This report is dedicated to the courageous survivors whose efforts have raised awareness about the seriousness of suicide, its devastating impact on families and friends and the dire need for prevention. Every year in Georgia, 900 people die, 2800 are hospitalized, and 5400 visit hospital emergency departments because of intentionally self-inflicted injuries.

Among young people 15 to 34 years of age,

suicide is the third most common cause of death in Georgia.

Total charges for hospitalizations with a diagnosis of self-inflicted injury at acute care nonfederal hospitals in Georgia exceeded \$32 million in 2002, and charges for hospital emergency room visits exceeded \$8 million.

Of Georgia middle school students, 8% report that they have ever attempted suicide, and 9% of Georgia high school students report that they have attempted suicide in the last 12 months.

Introduction

IN 2002, SUICIDE CLAIMED the lives of 900 Georgia residents and over 30,000 persons in the United States. In recent years, the public health importance of suicide has become more widely recognized. The Surgeon General's Call to Action to Prevent Suicide (1999), the National Strategy for Suicide Prevention (2001), and the Georgia Suicide Prevention Plan (2001) all call attention to the heavy burden of suicide on our society and the potential for suicide prevention. This report provides information about the burden of suicide and intentionally self-inflicted injuries in Georgia.

Suicide in Georgia

FROM 1999 THROUGH 2002, 3,520 GEORGIA RESIDENTS committed suicide, an average of 880 persons per year. Suicide was the 11th leading cause of death in Georgia in 2002 with 900 persons dying (Table 1). It was the third leading cause of death among persons 15 to 24 years and 25 to 34 years (Table 2).

Table 1: SUICIDE AND SELF-INFLICTED INJURY IN GEORGIA, 2002

*Number of deaths in age group, 1999-2002, including deaths that are not in the top 10 causes Note: ICD-10 cause-of-death lists (published by NCHS) were used for 1999-2002 deaths. Chronic kidney = Nephritis, nephrotic syndrome, nephrosis Chronic lung = Chronic lower respiratory diseases Congenital = Congenital malformations, deformations and

chromosomal abnormalities Diseases of circ sys = Diseases of the circulatory system

Heart = Diseases of the heart

Injury = Unintentional injury, including motor vehicle accidents

Maternal complic = Maternal complication of pregnancy Perinatal = Certain conditions of perinatal period Placenta, cord, membr = Complications of placenta, cord, membrane

Preg/childbirth = Pregnancy, childbirth & puerperium Resp distress = Respiratory distress of newborn SIDS = Sudden Infant Death Syndrome

TRENDS

THE AGE-ADJUSTED SUICIDE RATE in Georgia is similar to the national rate (Figure 1). The age-adjusted suicide rate in Georgia has declined slowly over the past two decades, from 13.6 per 100,000 in 1980 to 10.9 per 100,000 in 2002, paralleling the decline in the national rate.

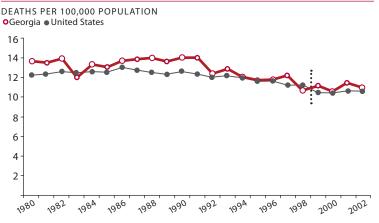

SEX AND RACE

THE AGE-ADJUSTED SUICIDE RATE for Georgia from 1999 through 2002 was over four times higher for men (18.9 per 100,000) than for women (4.2 per 100,000) and almost three times higher for whites (13.4 per 100000) than for blacks (4.9 per 100,000). White males had over twice the rate of black males, and white females had over five times the rate of black females (Figure 2). For these four years, an average of 705 males and 175 females died from suicide each year; an average of 752 whites and 115 blacks died from suicide each year.

SUICIDE RATES ARE HIGHEST AMONG the elderly in Georgia. From 1999 through 2002, persons 75 to 84 years of age had the highest suicide rate of any age group (Figure 3). Despite higher rates of suicide among the elderly, more young Georgians die from suicide than older adults because the younger population is larger than the older population. From 1999 through 2002, more than half the suicides in Georgia were among persons younger than 45 years of age (Figure 4).

AGE

NOTE: The dotted line indicates a change in coding systems used for cause of death. ICD-9 cades were used in 1980–1998 and the ICD-10 codes were used in the 1999–2001. Rates are age–adjusted to the 2000 US standard population.

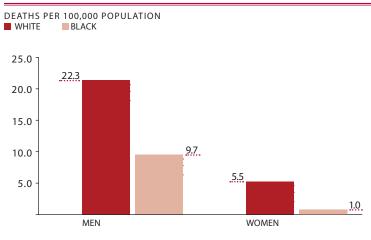

Figure 3. AGE SPECIFIC SUICIDE RATES, Georgia, 1999-2002

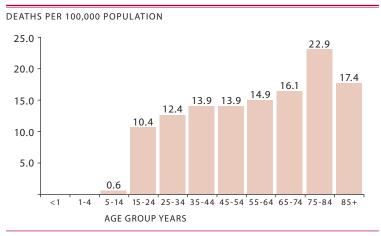

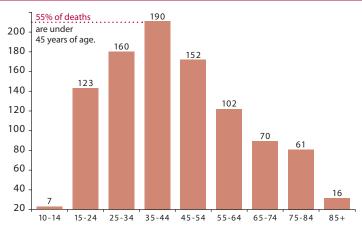

Figure 4. AVERAGE ANNUAL NUMBER OF SUICIDES BY AGE GROUP, 1999–2002, Georgia

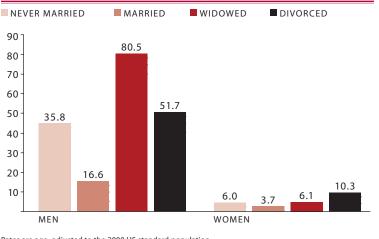

Rates are age-adjusted to the 2000 US standard population.

Rates are age-adjusted to the 2000 US standard population.

MARITAL STATUS

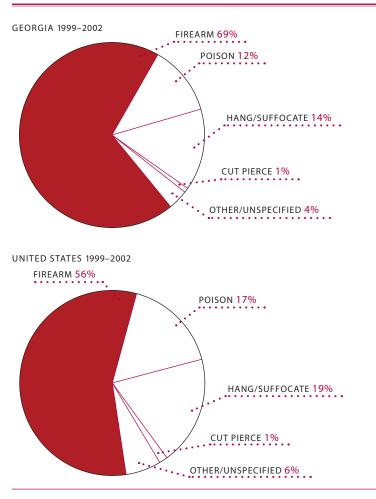

FROM 1999 THROUGH 2002 rates among men 15 years of age and older, rates were lowest for married men (16.6 per 100,000) and highest among widowers (80.5 per 100,000) (Figure 5). Among women 15 years of age and older, rates were lowest among married women (3.7 per 100,000) and highest in divorced women (10.3 per 100,000).

Rates are age-adjusted to the 2000 US standard population.

Figure 6. SUICIDE DEATHS BY METHOD, Georgia and the United States

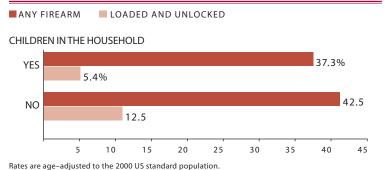

METHOD

IN GEORGIA FROM 1999 THROUGH 2002, 69% of suicides, or about 600 suicides per year, involved a firearm (Figure 6). The second most common method of suicide in Georgia was hanging or suffocation (14%). Nationwide, by contrast, 56% of suicides involved a firearm and 19% involved hanging or suffocation in 1999 through 2002.

Firearms were the most common method of suicide for both men and women, and young and old. Men dying from suicide in Georgia were more likely to use a firearm (72% of deaths) than women (56% of deaths). People less than 25 years of age were equally likely to use a firearm (67%) as people 25 years of age and older (69%).

Firearm suicides are associated with the presence of a firearm in the home. In 2001, 40% of adults 18 years and older in Georgia reported having a firearm in or around their home, and 10% of adult Georgians had a loaded unlocked firearm in the home. Nationwide, an estimated 30%-33% of homes have a firearm within; and in 6%-9% of homes the firearm is loaded and unlocked. In Georgia, non-Hispanic whites were more likely than non-Hispanic blacks or Hispanics to report any household firearms and loaded unlocked firearms. Prevalence of household firearms was higher in households without children, but 5% of adults living in households with children reported a loaded unlocked firearm in or around the home (Figure 7). The most current data on reasons for firearms in Georgia households are from 1999, with 48% of adults citing hunting or sport as the main reason for having a firearm in or around the home, and 35% citing protection.

Hospitalizations and Emergency Room Visits

HOSPITALIZATIONS

IN 2002, 2,842 GEORGIA RESIDENTS were hospitalized at nonfederal acute care hospitals in Georgia because of an intentional self-inflicted injury. The age-adjusted hospitalization rate was higher for women (37.9 per 100,000) than for men (26.9 per 100,000) and higher for Non-Hispanic whites (38.4 per 100,000) than for Non-Hispanic blacks (23.2 per 100,000) or Hispanics (18.0 per 100,000). Non-Hispanic white women had the highest hospitalization rate of any race/ethnicity/sex group (Figure 8). Age-specific hospitalization rates were highest for persons 15 to 54 years (Figure 9). Poisoning was the most common method (91%) of self-harm resulting in hospitalization (Figure 10). Substances used included tranquilizers and other psychotropic drugs (37% of poisonings) and pain/inflammation/fever relieving medications (27% of poisonings). Total charges for these hospitalizations exceeded \$32 million in 2002.

EMERGENCY ROOM VISITS

IN 2002, 5,435 GEORGIA RESIDENTS were treated in hospital owned emergency rooms (ERs) in Georgia because of a self-inflicted injury. Females (70.8 per 100,000) were more likely to visit ERs for self-inflicted injuries than males (51.0 per 100,000), and Non-Hispanic whites (69.6 per 100,000) were more likely to visit an ER than Non-Hispanic blacks (52.2 per 100,000) or Hispanics (34.5 per 100,000). Non-Hispanic white females (79.4 per 100,000) had the highest ER visit rate for self-inflicted injury among sex/race/ethnicity groups. Persons 15 to 24 years had the highest ER visit rate (157.9 per 100,000) of any age group. Poisoning, the most common method of self-harm leading to an ER visit, was involved in 70% of visits. Hospital charges for ER visits for self-inflicted injuries totaled approximately \$8 million.

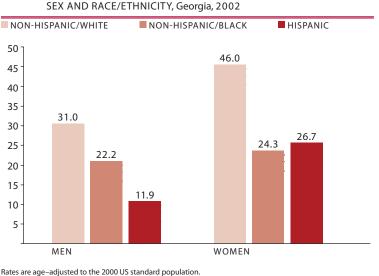

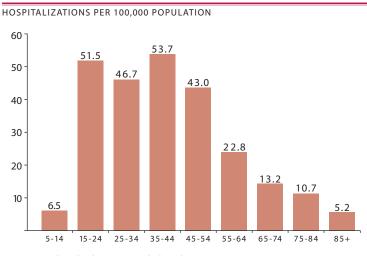

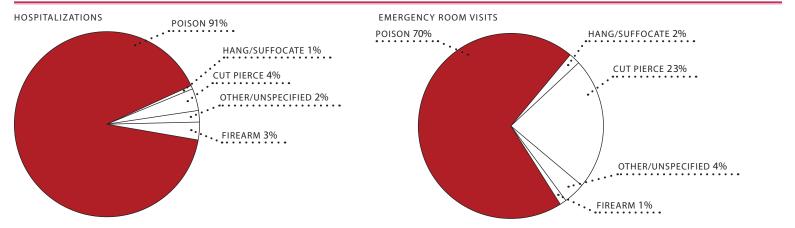

Figure 8. HOSPITALIZATION RATES FOR SELF-INFLICTED INJURY SEX AND RACE/ETHNICITY, Georgia, 2002

Figure 9. AGE–SPECIFIC HOSPITALIZATION RATES FOR SELF–INFLICTED INJURY, Georgia, 2002

Rates are age-adjusted to the 2000 US standard population.

Suicide Behavior Among Youth

DEATHS

FROM 1999 THROUGH 2002, 521 PERSONS less than 25 years of age died from suicide, an average of 130 per year. Most of these suicides (67%) were committed with firearms (Figure 11).

HOSPITALIZATIONS AND EMERGENCY ROOM VISITS

IN 2002, 718 PERSONS less than 25 years of age were hospitalized with self-inflicted injuries. Of these, 62% were females. Poisoning was the most common method (93%) of self-harm resulting in hospitalization in this age group (Figure 11). Pain/ inflammation/fever relieving medications, commonly purchased over the counter, were used in 43% of these poisonings.

In 2002, 2260 persons less than 25 years of age were treated in an ER for self-inflicted injury; of these, 59% were females. Poisoning was the most common method (70%) of self-harm resulting in ER visits in this age group. Pain/inflammation/fever relieving medications, commonly purchased over the counter, were used in 37% of these poisoning.

Self-inflicted injury by persons less than 25 years of age resulted in approximately \$6 million in hospitalization charges and \$3 million in ER charges in 2002 in Georgia.

Suicide-related Feelings, Thoughts, Behaviors

Among middle school students, 13% reported that at some time in their lives they had made a plan to kill themselves, and 8% had ever attempted suicide (Figure 12). High school students reported that during the past 12 months 13% made a plan to commit suicide and 9% attempted suicide.

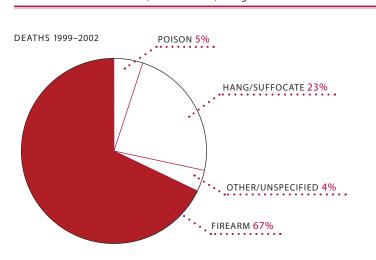

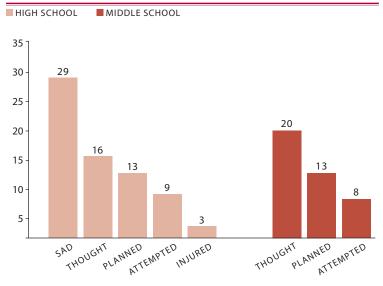

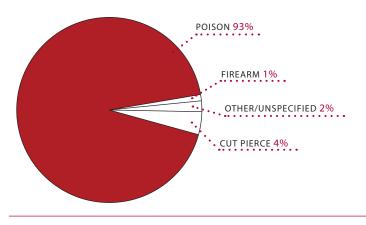

Figure 11. SUICIDES AND HOSPITALIZATIONS FOR SELF-INFLICTED INJURY METHOD, PERSONS <25, Georgia

HOSPITALIZATIONS 1999-2002

Suicide Statistics by County and District

AGE-ADJUSTED COUNTY SUICIDE RATES from 1994 through 2002 indicate that suicide rates are higher in counties outside of metro areas (Figure 13, Tables 3-4). In aggregate, counties designated as metropolitan statistical areas (MSAs) had a lower suicide rate (10.5 per 100,000) than non-MSA counties combined (12.6 per 100,000) from 1999 through 2002.

Risk Factors and Protective Actions for

RISK FACTOR

Mental disorders—particularly mood disorders such as depression and bi-polar disorder

PROTECTIVE ACTION

Appropriate clinical care for mood disorders

Substance abuse	Appropriate clinical care for substance abuse
Physical illness	Appropriate clinical care of physical illness
Barriers to appropriate clinical care	Improved access and coverage for mental health, substance abuse and physical health problems
Easy access to highly lethal (e.g., firearms) or common methods (e.g., sedatives) of suicide	Restricted access to highly lethal or common methods of suicide
Family history of suicide or previous suicide attempt	Recognition and referral
Financial loss or social isolation	Family and community support
Cultural or religious beliefs that suicide is a noble resolution	Cultural or religious beliefs that discourage suicide

The Georgia Suicide Prevention Plan

In 1999, the Surgeon General released the Call to Action to Prevent Suicide, identifying suicide as a national priority because of its large impact not only upon victims but on family members, friends, and society at large. This was followed in 2001 by the National Strategy for Suicide Prevention: Goals and Objectives for Action. The Georgia Suicide Prevention Plan was developed in 2001. It was modeled after the National Strategy and supported by funds allocated by the Georgia Legislature. The three primary Action Steps of the National and the Georgia Plan are Awareness, Intervention, and Methodology.

Action Step: Awareness

- Promote awareness that suicide is a serious public health problem and that many suicides are preventable.
- Develop broad-based support of suicide prevention.
- Develop and implement strategies to reduce the stigma associated with being a consumer of mental health, substance abuse and suicide prevention services.

Action Step: Intervention

- Develop and implement community based suicide prevention programs.
- Promote efforts to reduce access to lethal means of self harm.
- Implement training for recognition of at-risk behavior and delivery of effective treatment.

- Develop and promote effective professional practices and support services.
- Improve access to and community linkages with mental health and substance abuse services.
- Improve reporting and portrayals of suicidal behavior, mental illnesses and substance abuse in the entertainment and news media.

Action Step: Methodology

- Promote and support research and evaluation on suicide prevention.
- Improve and expand systems for data collection.

Summary and Recommendations

Suicide is a serious public health problem. Every year in Georgia, about 900 people die, 2800 are hospitalized, and 5400 visit hospital emergency departments because of intentionally self-inflicted injuries. The majority of persons dying are younger than 45 years of age, and the majority of suicides involve firearms.

Suicide is costly. In Georgia, the financial burden from hospitalization and emergency room charges alone exceeded \$40 million per year. In addition to the financial cost is the suffering experienced by the family members and friends of those that have died by suicide.

Suicide can be prevented. Suicide rates in Georgia can be reduced by a combination of 1) increased awareness of the risk factors for suicide, 2) improved services and programs, 3) restricted access to highly lethal and common methods of suicide, and 4) evaluation of suicide prevention efforts. Accomplishing these tasks will require collaboration among a broad spectrum of public and private organizations and agencies.

Technical Notes

Age-adjusted mortality rates for the US from 1980 through 2001 were obtained via WONDER at http://wonder.cdc.gov from the compressed mortality file compiled by the National Center for Health Statistics at the Centers for Disease Control and Prevention. Deaths with underlying cause of death coded as suicide (E950-E959 in 1980-1998 and X60-X84, Y87.0 in 1999-2002) were selected.

Age-adjusted deaths rates for Georgia from 1980 through 1993 were also obtained via WONDER. Age-adjusted mortality rates for Georgia in 1994 through 2002 were based on death certificate data provided by the Vital Records Branch and Office of Health Information and Policy of the Georgia Division of Public Health. Deaths with underlying cause coded as suicide were selected. Age-adjusted death rates for Georgia were calculated using the direct method with population estimates from the U.S. Census Bureau and the U.S. 2000 Standard Population as the standard.

The data set on hospitalizations and emergency room (ER) visits at acute care hospitals in Georgia in 2002 was provided by the Office of Health Information and Policy after compilation by the Georgia Hospital Association. ER data do not include persons who were admitted to the hospital from the ER. Analyses were restricted to Georgia residents. Hospitalizations and ER visits for self-inflicted injuries were defined as those with an injury code for the principal diagnosis and a self-harm code (E950-959) for any other diagnosis, as recommended by the State and Territorial Injury Prevention Directors Association (STIPDA). Several hundred patients with a principal diagnosis of a mental health disorder (not an injury) plus a self-harm code were excluded from our analyses. Age-adjusted hospitalization and ER rates were calculated using the direct method with population estimates from the U.S. Census Bureau and the U.S. 2000 Standard Population as the standard. Age-adjusted mortality rates for counties and districts were calculated using data from death certificates provided by Vital Statistics Branch and Office of Health Information and Policy. The number of deaths for 1994 through 2002 was determined by selecting records with underlying cause of death coded as E950-959 in 1994-1998 (ICD-9) or X60-X84,Y87.0 in 1999-2002 (ICD-10). The number of deaths for 1994-1998 was multiplied by the "comparability ratio" provided by NCHS (National Vital Statistics Reports, Vol 49, No. 3) for suicide (0.9962), before calculating age-adjusted mortality rates. The "comparability ratio" compensates for the change in coding systems. Age-adjusted mortality rates were calculated using using the direct method with population estimates from the U.S. Census Bureau and the U.S. 2000 Standard Population as the standard.

Data on suicidal ideation and behavior were obtained from the 2003 Georgia Student Health Survey, a written survey conducted in a representative sample of public middle schools and high schools throughout the state. The data were weighted to reflect the likelihood of sampling each student and to reduce bias by compensating for differing patterns of nonresponse. Data on firearms in households were obtained from the Behavioral Risk Factor Surveillance System, a telephone survey conducted annually with a sample of adults aged > 18 years. The sample is weighted to reflect an individual's probability of selection and to adjust for nonresponse. In 2001, respondents were asked "Are there any firearms now kept in or around your home? Include those kept in a garage, outdoor storage area, car, truck, or other motor vehicle." If they answered "yes," they were asked "Is there a firearm around your home that is now both loaded and unlocked?" National estimates of firearm ownership and storage practices were taken from the article, Johnson RM, et al., Firearm ownership and storage practices, U.S. households, 1992-2002. Am J Prev Med 2004;27:173-182. The association between firearms and suicide in the home is described in a recent article by Dahlberg LL, et al. (Guns in the home and risk of a violent death in the home: Findings from a national study. Am J Epidemiol 2004;10:929-936).
