

Chagas Disease (American trypanosomiasis) Frequently Asked Questions

What is Chagas disease?

Also called American trypanosomiasis (tri-PAN-o-so-MY-a-sis), Chagas disease is an infection caused by the parasite *Trypanosoma cruzi*. Worldwide, it is estimated that 16 to 18 million people are infected with Chagas disease; of those infected, 50,000 will die each year.

Where is Chagas disease found?

Chagas disease is locally transmitted in Argentina, Belize, Bolivia, Brazil, Colombia, Costa Rica, Ecuador, El Salvador, French Guiana, Guatemala, Guyana, Honduras, Mexico, Nicaragua, Panama, Paraguay, Peru, Suriname, and Venezuela. It is sometimes transmitted in the United States. There has never been a locally-acquired case of Chagas disease reported in Georgia.

How concerned should I be about Chagas disease in Georgia?

Chagas disease is extremely rare in Georgia. In fact, in the United States only five insect-borne cases have ever been reported in humans (none of those cases were in Georgia).

How is Chagas disease spread?

Triatomine bugs (or "kissing" bugs) live in cracks and holes of substandard housing from the southern United States to southern Argentina. The blood sucking bugs are primarily found in Central and South America and Mexico. Triatomine (sometimes also called reduviid) bugs become infected after biting an animal or person, who is already infected with the parasite. People can become infected with Chagas by:

- unknowingly touching their eyes, mouth, or open cuts after having come into contact with infective triatome bug feces
- bugs directly depositing infected feces in their eyes
- eating uncooked food contaminated with triatome bug feces
- receiving infection from mother during pregnancy or at birth
- receiving an infected blood transfusion or organ transplant

Animals can become infected in the same way, or they might eat an infected bug.

What are the symptoms of Chagas disease?

There are three stages of infection in Chagas disease; each stage has different symptoms. On one extreme, some persons may be infected and never develop symptoms. On the other extreme, in people who have weakened immune systems, such as those with HIV/AIDS, the symptoms of Chagas disease can be severe.

1. Acute stage:

Acute symptoms only occur in about 1 percent of cases (one in a hundred). The most recognized symptom of acute Chagas infection is the Romaña's sign – a person's eye on one side of the face swells, usually at the bite wound or where feces were deposited or accidentally rubbed into the eye. Other symptoms that are not unique to Chagas disease may include:

- fatigue, fever, enlarged liver or spleen
- swollen lymph glands

Sometimes a person develops a rash, loss of appetite, diarrhea, and vomiting. In infants and in very young children with acute Chagas disease, the brain may be damaged severely enough to cause death. In general, a person's symptoms last from 4 to 8 weeks and then they go away, even without treatment.

2. Indeterminate stage:

Eight to 10 weeks after infection, the indeterminate stage begins and may last for many years. During this stage, people do not have symptoms.

3. Chronic stage:

Ten to 30 or 40 years after infection, 20-30% of infected people may develop the most serious symptoms of Chagas disease, such as

- cardiac problems, including an enlarged heart; altered heart rate or rhythm; heart failure; or cardiac arrest. And,
- enlargement of the esophagus or large bowel, which results in problems with swallowing or severe constipation.

Not everyone with Chagas disease will develop the chronic-stage symptoms.

What is the treatment for Chagas disease?

Medication for Chagas disease is usually effective when given during the early acute stage of infection. Once the disease has progressed to later stages, medication may be less effective. In the late chronic stages of infection, treatment focuses on managing the symptoms associated with the disease. There is no vaccine to prevent Chagas disease.

How can I prevent myself from being infected with Chagas disease?

You can prevent Chagas disease while traveling if you:

- Avoid sleeping in thatch, mud, or adobe houses.
- Use insecticides to kill bugs and reduce the risk of transmission.
- Remain aware that, in some countries, the blood supply may not always be screened for Chagas disease and blood transfusions may carry a risk of infection.

Whom should I contact for more information?

- For general information about Chagas disease and surveillance for vector-borne diseases in Georgia, call your county health department or the Georgia Department of Public Health at 404-657-2588. You may also visit the Georgia Department of Public Health website at <http://health.state.ga.us/epi/vbd/mosquito.asp>.
- For national Chagas disease information, visit the CDC website at <http://www.cdc.gov/parasites/chagas/>
- For worldwide Chagas disease information, visit the World Health Organization's website at http://www.who.int/topics/chagas_disease/en/
