Epidemiology and Surveillance in Chronic Disease Prevention and Control

Ping Johnson, PhD
Professor
Department of Health Promotion and Physical Education
Objectives

• By the end of the presentation, the participant will be able to:
  – Describe the common tasks and role of epidemiology in chronic disease prevention and control
  – Discuss the functions of surveillance in chronic disease control and prevention
  – Identify the multiple risk factors associated with common chronic diseases
  – Compare and contrast the foci and activities of the three levels of prevention in public health
Basic Concepts

• Epidemiology
  – Study the distribution and determinants of health problems
  – Apply the study results to prevention and control of health problems
    • Distribution
      – Study of frequency and pattern of health events in the population
      – Frequency – number, and number in relation to the population
      – Pattern – the health-related state or event by person, place, and time characteristics
    • Determinants
      – Search for causes and other factors of health-related states or events
  – Base on systematic and objective approach to data collection, analysis, and interpretation
Epidemiology Common Tasks

• Identifying risk factors for disease, injury, and death
• Describing the natural history of disease
• Identifying individuals and populations at greatest risk for disease
• Identifying where the public health problem is greatest
• Monitoring diseases and other health-related events over time
• Evaluating the efficacy and effectiveness of prevention and treatment programs
• Providing information useful in health planning and decision making for establishing health programs with appropriate priorities
• Assisting in carrying out public health programs
• Being a resource person
• Communicating public health information

Merrill, R. M. 2017. Introduction to Epidemiology (7th Ed.) Sudbury, MA: Jones and Bartlett Publishers.
Role of Epidemiology

• Epidemiological findings contribute to
  – Preventing and controlling disease, injury, disability, death by
    • Providing information that leads to
      – informed public health policy and planning
      – individual health decision making

• Selected type of epidemiologic information
  – Public health assessment
  – Causes of disease
  – Completing the clinical picture
  – Program evaluation
    • Efficacy
    • Effectiveness
Epidemiology helps answer questions of

- **Diagnosis:**
  - Is there such a problem as myalgic encephalitis?
  - Is prostate specific antigen a good test for prostate cancer?
- **Causes:**
  - Why did this patient suffer from a stroke?
  - Is obesity the cause of metabolic syndrome?
- **Treatment:**
  - Is this the best treatment for Parkinson’s disease?
  - Is my surgery as good as that of everyone else?
- **Prognosis:**
  - What are the chances of a recurrent heart attack?
  - How long will this knee joint prosthesis last?
• Health promotion and protection:
  – Do current school meals harm children’s future health?
  – Will the Irish smoking ban in public places work better than the English policy?

• Health and disease surveillance:
  – Why are there tenfold international differences in suicide rates?
  – When will the next influenza pandemic occur?

• Health inequalities:
  – Why should life expectancy be nearly five years lower in unskilled manual workers?
    • Do health services reduce or increase health inequalities?

*Merrill, R. M. 2017. Introduction to Epidemiology (7th Ed.) Sudbury, MA: Jones and Bartlett Publishers.*
Objectives

• By the end of the presentation, the participant will be able to:
  – Describe the common tasks and role of epidemiology in chronic disease prevention and control
  – Discuss the functions of surveillance in chronic disease control and prevention
  – Identify the multiple risk factors associated with common chronic diseases
  – Compare and contrast the foci and activities of the three levels of prevention in public health
Surveillance

• Medical surveillance
  • Close observation of individuals exposed to a communicable disease
    – Detect early cases
    – Prompt isolation and control

• Public health surveillance
  • Systematic ongoing collection, analysis, interpretation, and dissemination of health data
    • Identify outbreaks: early warning => public health emergencies
    • Inform prevention and control measures

Merrill, R. M. 2017. Introduction to Epidemiology (7th Ed.) Sudbury, MA: Jones and Bartlett Publishers.
Public Health Surveillance Functions

- Monitoring
  - Identify sudden changes in occurrence
  - Follow long-term trends and patterns
  - Identify changes in risk factors
  - Document program impact, progress
  - Help identify
    - Whether a health problem exists
    - Whether the problem is getting worse
  - Help set priorities
  - Help develop public health policy and strategies
Public Health Surveillance Functions

- **An effective surveillance system has the following functions:**
  - detection and notification of health events
  - collection and consolidation of pertinent data
  - investigation and confirmation (epidemiological, clinical and/or laboratory) of cases or outbreaks
  - routine analysis and creation of reports
  - feedback of information to those providing the data
  - feed-forward (i.e. the forwarding of data to more central levels)
  - reporting data to the next administrative level
Public Health Surveillance Functions

- Detection and notification
- Data collection and consolidation
- Investigation and confirmation (epidemiological, clinical, laboratory)
- Data analysis and creation of reports
- Feedback of info to persons providing data
- Feed-forward (forward report to central location)
- Reporting data to next administrative level

http://www.who.int/immunization/monitoring_surveillance/burden/vpd/en/
Public Health Surveillance Functions

• Evaluation
  – Health programs may be aimed at
    • Increasing vaccination levels
    • Reducing smoking
    • Increasing fruit and vegetable consumption
    • Increasing physical activity
    • Decreasing obesity
    • Increasing screening

Merrill, R. M. 2017. Introduction to Epidemiology (7th Ed.) Sudbury, MA: Jones and Bartlett Publishers.
Surveillance Example

- **Vaccine Preventable Disease**
  - State public health officials monitor vaccine preventable disease rates
  - May signal that the vaccination program is not reaching specific at-risk populations
  - Monitoring rates by racial/ethnic groups
    - E.g.: increasing rate exists among a given minority group
  - Do barriers exist related to culture, language, and access to care?
  - The vaccination program should then be altered to address these barriers

*Merrill, R. M. 2017. Introduction to Epidemiology (7th Ed.) Sudbury, MA: Jones and Bartlett Publishers.*
To set objectives of surveillance, ask:

- What is the **health-related event** under surveillance? What is its **case definition**?
- What is the **purpose** and what are the **objectives** of surveillance?
- What are the **planned uses** of the surveillance data?
- What is the **legal authority** for any data collection?
- Where is the **organizational home** of the surveillance?
- Is the system **integrated** with other surveillance and health information systems?
- What is the **population** under surveillance?
• What is the **frequency** of data collection (weekly, monthly, annually)?

• What **data** are collected and **how**? Would a **sentinel** approach or **sampling** be more effective?

• What are the **data sources**? What **approach** is used to obtain data?

• During what **period** should surveillance be conducted? Does it need to be continuous, or can it be intermittent or short-term?
- How are the data **processed** and **managed**? How are they routed, transferred, stored? Does the system comply with applicable standards for data formats and coding schemes? How is confidentiality maintained?

- How are the data **analyzed**? By whom? How often? How thoroughly?

- How is the information **disseminated**? How often are reports distributed? To whom? Does it get to all those who need to know, including the medical and public health communities and policymakers?

Physical Stresses And Health

- Excessive heat, cold, and noise
- Radiation (electromagnetic, ultrasound, microwave, x-irradiation)
- Vehicular collisions
- Workplace injuries
- Climate change
- Ozone depletion
- Housing
- ...

Merrill, R. M. 2017. Introduction to Epidemiology (7th Ed.) Sudbury, MA: Jones and Bartlett Publishers.

FIGURE 11-3 Sources of radiation exposure in the United States.
Several chemicals in the environment are capable of causing chronic disease and adverse health conditions:

- Drugs
- Acids
- Alkali
- Heavy metals (e.g., lead)
- Poisons
- Some enzymes

**Merrill, R. M. 2017. Introduction to Epidemiology (7th Ed.) Sudbury, MA: Jones and Bartlett Publishers.**

Social Environment And Health

- War – Mental and physical disabilities
- Families and households – Dietary behaviors
- Social networks and social supports – foster the ability to deal with and survive chronic health problems
- Neighborhoods and communities – may include environments that facilitate physical activity (e.g., parks and recreational centers, bike paths, and safe walking areas), which in turn reduces the risk of certain chronic conditions
- Public health policy (e.g., no smoking in public places) – may reduce exposure to individuals of risk factors for certain chronic diseases

Merrill, R. M. 2017. Introduction to Epidemiology (7th Ed.) Sudbury, MA: Jones and Bartlett Publishers.
Behavior and Chronic Health Problems

- Many of the diseases and conditions today are influenced by lifestyles of modern populations
  - Career pressures
  - Sedentary lifestyles
  - High density population living
  - Poor diet
  - Crime
  - Drugs
  - Gangs
  - Poverty
  - Pollution
  - Fear
  - Stress
  - Economic struggles

Merrill, R. M. 2017. Introduction to Epidemiology (7th Ed.)
Sudbury, MA: Jones and Bartlett Publishers.
Multifactorial etiology in chronic disease epidemiology

- Prevention and control of noninfectious diseases and conditions is often much more complicated than that of infectious diseases
  - The interaction between behavior, environment, genetic, and social risk factors often make prevention efforts complex and sometimes infeasible
  - Prevention programs need to be specifically tailored to given societies and cultures
  - Despite the complexities of primary prevention, it provides the greatest potential for minimizing public suffering and health-care costs

Merrill, R. M. 2017. Introduction to Epidemiology (7th Ed.) Sudbury, MA: Jones and Bartlett Publishers.
Objectives

• By the end of the presentation, the participant will be able to:
  – Describe the common tasks and role of epidemiology in chronic disease prevention and control
  – Discuss the functions of surveillance in chronic disease control and prevention
  – Identify the multiple risk factors associated with common chronic diseases
  – Compare and contrast the foci and activities of the three levels of prevention in public health
Three Levels of Prevention

<table>
<thead>
<tr>
<th>Health Status</th>
<th>Levels of Prevention</th>
</tr>
</thead>
<tbody>
<tr>
<td>Healthy; without signs and symptoms of disease, illness, or injury</td>
<td><strong>Primary prevention</strong> — Preventive measures that forestall the onset of illness or injury during the pre-pathogenesis period</td>
</tr>
<tr>
<td>Disease, illness, or injury</td>
<td><strong>Secondary prevention</strong> — Preventive measures that lead to early diagnosis and prompt treatment of a disease, illness, or injury to limit disability, impairment, or dependency and prevent more severe pathogenesis</td>
</tr>
<tr>
<td>Disability, impairment, or dependency</td>
<td><strong>Tertiary prevention</strong> — Preventive measures aimed at rehabilitation following significant pathogenesis</td>
</tr>
<tr>
<td>Death</td>
<td><strong>Level of Prevention</strong></td>
</tr>
</tbody>
</table>
Primary Prevention

• Active Primary Prevention
  – Requires behavior change on part of subject
    • Wearing protective devices
    • Health promotion
    • Lifestyle changes
    • Community health education
    • Ensuring healthy conditions at home, school, and workplace

• Passive Primary Prevention
  – Does not require behavior change
    • Vitamin-fortified foods
    • Fluoridation of public water supplies

Merrill, R. M. 2017. Introduction to Epidemiology (7th Ed.)
Sudbury, MA: Jones and Bartlett Publishers.
Secondary Prevention

• Occurs to reduce the progress of disease
• The disease already exists in the person
  – Cancer screening – Cancer already present; the goal is to detect the cancer before clinical symptoms arise in order to improve prognosis and prevent conditions from progressing and from spreading

Merrill, R. M. 2017. Introduction to Epidemiology (7th Ed.) Sudbury, MA: Jones and Bartlett Publishers.
Tertiary Prevention

- To reduce the limitation of disability from disease
- The disease has already occurred
  - Physical therapy for stroke victims
  - Halfway houses for recovering alcoholics
  - Shelter homes for the developmentally disabled
  - Fitness programs for heart attack patients

</tbody>
</table>
Research Milestones (selected)

2002  Obesity is a risk factor for heart failure
      Network phenomena appear to be relevant to the biologic and behavioral trait of obesity

2007  Obesity appears to spread through social ties

2008  Social networks exert key influences on decision to quit smoking

2009  Parental dementia may lead to poor memory in middle-aged adults
      High leptin levels may protect against Alzheimer's disease and dementia

2010  Sleep apnea tied to increased risk of stroke
      Fat around the abdomen associated with smaller, older brains in middle-aged adults
      Occurrence of stroke by age 65 years in a parent increased risk of stroke in offspring by 3-fold
Nurses' Health Study

• The largest, longest running investigations of women’s health
• Starting with the original Nurses’ Health Study in 1976
• Now in the third generation with Nurses’ Health Study 3 (which is still enrolling male and female nurses) and count more than 275,000 participants
• Key research findings
### Key research findings from the Nurses’ Health Studies

<tr>
<td><strong>Other exposures</strong></td>
<td>Family history of breast cancer, high breast density, high circulating hormone levels, and shift work all increase risk</td>
<td>Snoring is associated with a modest but significantly increased risk of CHD and stroke</td>
<td>&gt;10 years of aspirin use reduces risk; family history increases risk</td>
<td>Diabetes and increasing years spent working rotating night shifts increase risk</td>
<td>Type 2 diabetes and higher insulin, even in women without diabetes, increase risk</td>
<td>Diabetes increases risk of glaucoma and cataracts; positive family history and African heritage increases risk of glaucoma</td>
</tr>
</tbody>
</table>
Cancer Prevention Studies

- Conducted by American Cancer Society
- Hammond-Horn Study: 1952-1955
  - helped to establish cigarette smoking as a cause of death from lung cancer and coronary heart disease
- CPS-1: 1959-1972
  - demonstrated sharp increase in lung cancer death rates among US women between 1959 and 1972 occurred only in smokers
  - First study to show a relationship between obesity and shortened overall survival
- CPS-2: 1982- last survey questionnaire sent in 2007
- CPS-3: 2006-current
Other key findings from CPS studies

- Cigarettes with reduced yield of tar and nicotine do not reduce the risk of lung cancer.
- Obesity is associated with increased death rates from at least ten cancer sites, including colon and post-menopausal breast cancer.
- Discovery of the link between aspirin use and lower risk of colon cancer opened the door to research on chronic inflammation and cancer.
- Relationships of other potentially modifiable factors such as physical inactivity, prolonged hormone use and certain dietary factors with cancer risk.
- Air pollution, especially small particulates and ozone, increase death rates from heart and lung conditions. CPS-II findings helped to motivate the Environmental Protection Agency to propose more stringent limits on air pollution.
GA Chronic Disease Prevention Programs (selected)

- Georgia Asthma Control Program (GACP)
- Georgia Comprehensive Cancer Control Program (CCCP)
- Hypertension Management and Outreach Program (HMOP)
- Georgia Stroke and Heart Attack Prevention Program (Georgia SHAPP)
- Georgia Tobacco Use Prevention Program (GTUPP)
- Georgia Tobacco Quit Line (GTQL)
