Week 47 (November 18 — November 24, 2018)

Snapshot of Influenza Activity During Week 47:

- **Outpatient Illness Surveillance (ILINet):** The proportion of outpatient visits for ILI was **4.5%**, which is **ABOVE** the regional baseline of 2.2%
- **Activity Indicator Map:** **HIGH**
- **Geographic Spread of Influenza:** **LOCAL**
- **Influenza-associated Deaths:** 0 deaths was confirmed
- **Metro Area Hospitalizations:** 21 hospitalizations were reported
- **Influenza Outbreaks:** 0 outbreaks were reported
- **Viral Surveillance:** The percent of specimens testing positive for influenza by clinical laboratories was **8%**
- **RSV Season Status:** **ON**

Outpatient Illness Surveillance

In Georgia during week 47, 4.5% of patient visits reported through the U.S. Outpatient Influenza-like Illness Surveillance Network (ILINet) were due to influenza-like illness (ILI). The percentage is above the regional baseline of 2.2%. (ILI is defined as fever (temperature of 100°F [37.8°C] or greater) and cough and/or sore throat.)

A total of 96 sentinel providers reported data for week 47.

Note: The regional baseline is formulated by averaging ILI percentage during weeks of endemic activity determined by laboratory results for influenza. HHS Region 4 (AL, FL, GA, KY, MS, NC, SC, and TN) (Baseline: 2.2%).

ILI Activity Indicator

ILI Activity Levels measure ILI activity each week. Activity levels are based on the percent of outpatient visits in Georgia due to ILI compared to the 3 year average of ILI visits during weeks with little or no influenza virus circulation.

During week 47, the activity level in Georgia was **HIGH = 9**

Geographic Spread of Influenza

Geographic spread is measured weekly and reflects geographic dispersion of influenza and is not an indicator of influenza severity.

During week 47, the geographic spread of influenza in Georgia was **LOCAL**

No Activity: No laboratory-confirmed cases of influenza and no reported increase in the number of cases of ILI.

Sporadic: Small numbers of laboratory-confirmed influenza cases or a single laboratory-confirmed influenza outbreak has been reported, but there is no increase in cases of ILI.

Local: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in a single region of the state.

Regional: Outbreaks of influenza or increases in ILI and recent laboratory confirmed influenza in at least two but less than half the regions of the state with recent laboratory evidence of influenza in those regions.

Widespread: Outbreaks of influenza or increases in ILI cases and recent laboratory-confirmed influenza in at least half the regions of the state with recent laboratory evidence of influenza in the state.
Influenza-Associated Mortality

Influenza-associated deaths (in all ages) are reportable by law in the state of Georgia. To be confirmed as an influenza-associated death, the person must have a clinically compatible illness, a positive influenza test, no documented recovery between the illness and death.

There were 0 influenza-associated deaths reported in Georgia during week 47.

A total of 1 influenza-associated deaths have been reported for the 2018-2019 season.

Influenza-Associated Hospitalizations

The Influenza Hospitalization Surveillance Network (FluSurv-Net) reports laboratory confirmed influenza hospitalizations in the eight county metro Atlanta area (Fulton, DeKalb, Clayton, Cobb, Douglas, Gwinnett, Rockdale, and Newton) for the 2018-2019 influenza season.

There were 21 laboratory confirmed influenza hospitalizations confirmed for week 47.

A total of 74 laboratory confirmed influenza hospitalizations have been reported for the 2018-2019 season.

Influenza Outbreaks

Influenza outbreaks are reportable by law in the state of Georgia.

0 influenza outbreaks were confirmed for week 47.

A total of 0 laboratory confirmed influenza outbreaks have been reported in Georgia for the 2018-2019 season.

Weekly Georgia, Summary, 2018-19 Influenza Season
Virologic Surveillance

The National Respiratory and Enteric Virus Surveillance System (NREVSS) and World Health Organization (WHO) collaborating laboratories (a combination of clinical and public health laboratories) report the total number of respiratory specimens tested for influenza and the number of positive for influenza, by virus type. Public Health Laboratories provide data about influenza virus subtypes and lineages (next page).

Respiratory Syncytial Virus Infection (RSV) Surveillance

Data from NREVSS are also analyzed to measure the RSV seasonality. RSV season onset is defined as the first week of two (2) consecutive weeks when the percent positive of ALL laboratory confirmed tests are greater than or equal to 10%. The end of RSV season is now defined as the first week of two consecutive weeks when the percent positive of ALL laboratory confirmed tests are less than 10%.

RSV Season Status: **ON**

During week 47, clinical laboratories in Georgia reported testing 172 specimens, of which 27% were positive for RSV.
